

# Quality of Service Task Force

---

## Service Level Agreements in Enterprise QoS: A Boeing Scenario

Carl F. Bunje, Jr. – Boeing  
David M. Lounsbury – Open Group

QoS Task Force  
Open Group Members Conference  
Cannes, France  
16 October 2002

Selected slides from presentation at:  
Open Group Members Conference  
Amsterdam, Netherlands  
25 October 2001

THE *Open* GROUP

# DCAC/MRM Overview

---

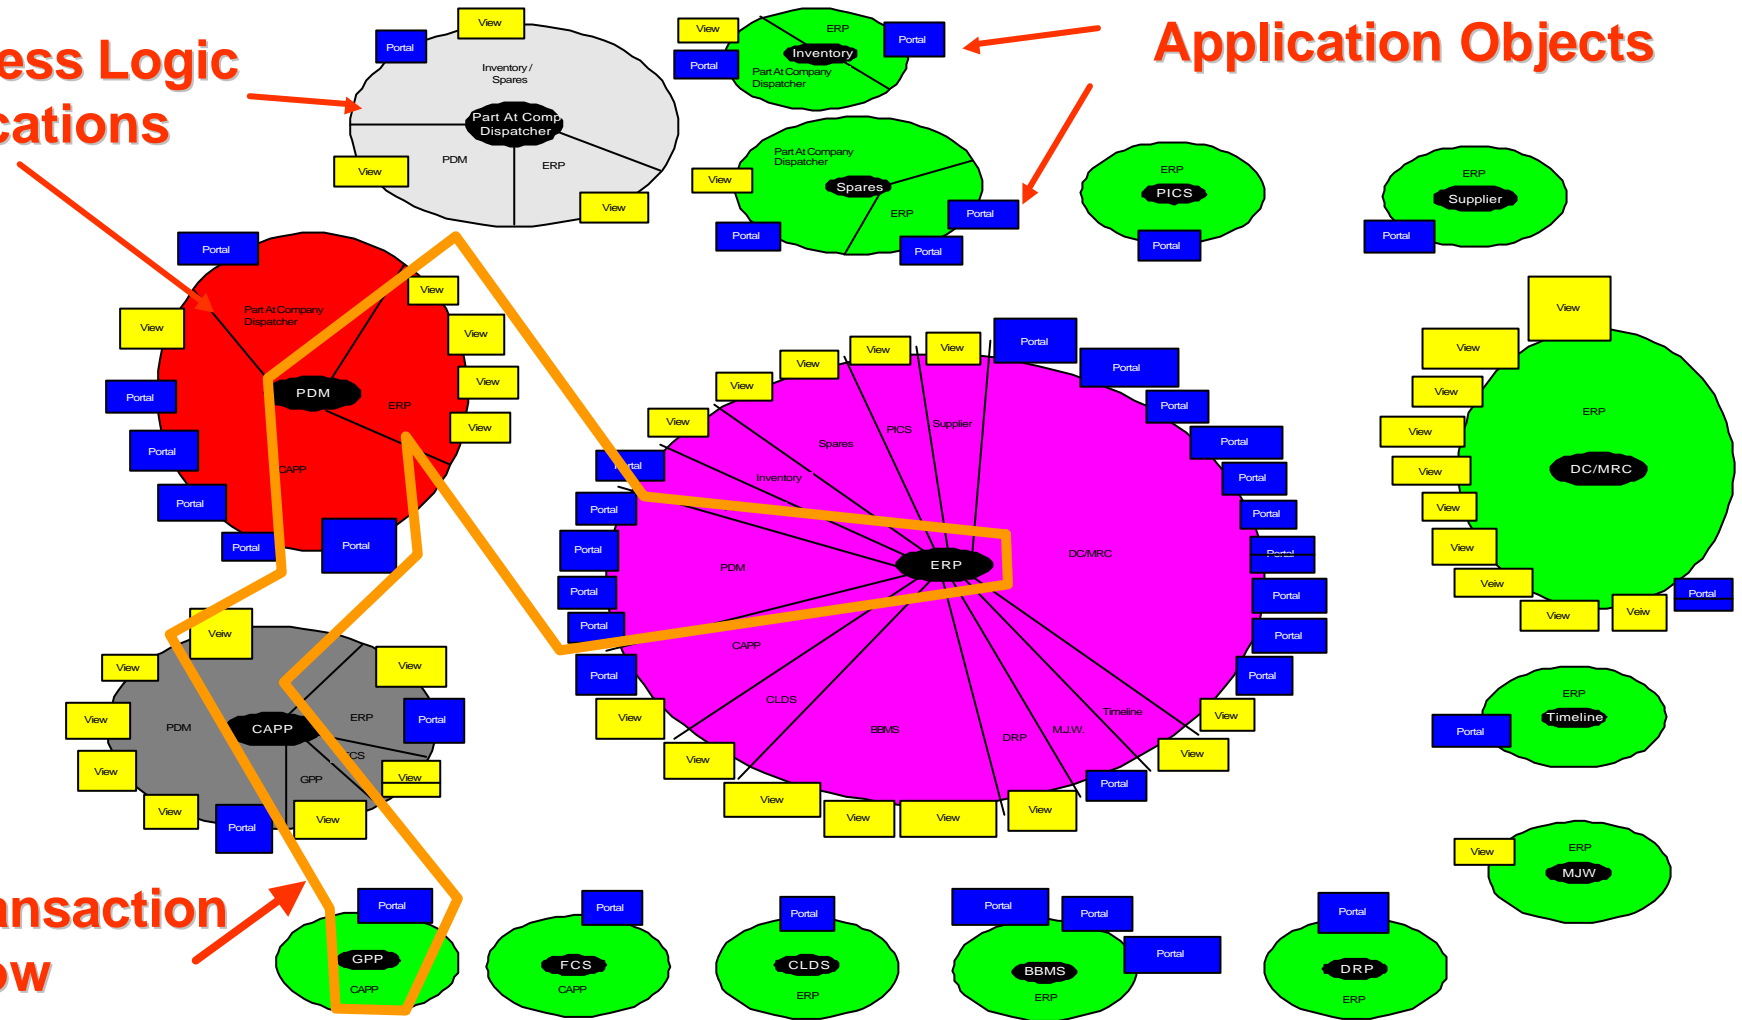

- ❑ Integrated collection of (large) applications containing business logic and data
  - Computer-Aided Process Planning (CAPP)
  - Product Data Manager (PDM)
  - Enterprise Resource Planner (ERP)
  - etc.
- ❑ Integrated through object wrappers on application functions and an extensive, custom, CORBA-based Application Integration (AI) layer
- ❑ Multi-
  - System
  - Site
  - Vendor

# DCAC/MRM SLA Environment

**Business Logic Applications**

**Application Objects**

**Transaction Flow**

# Business Drivers for SLAs

---

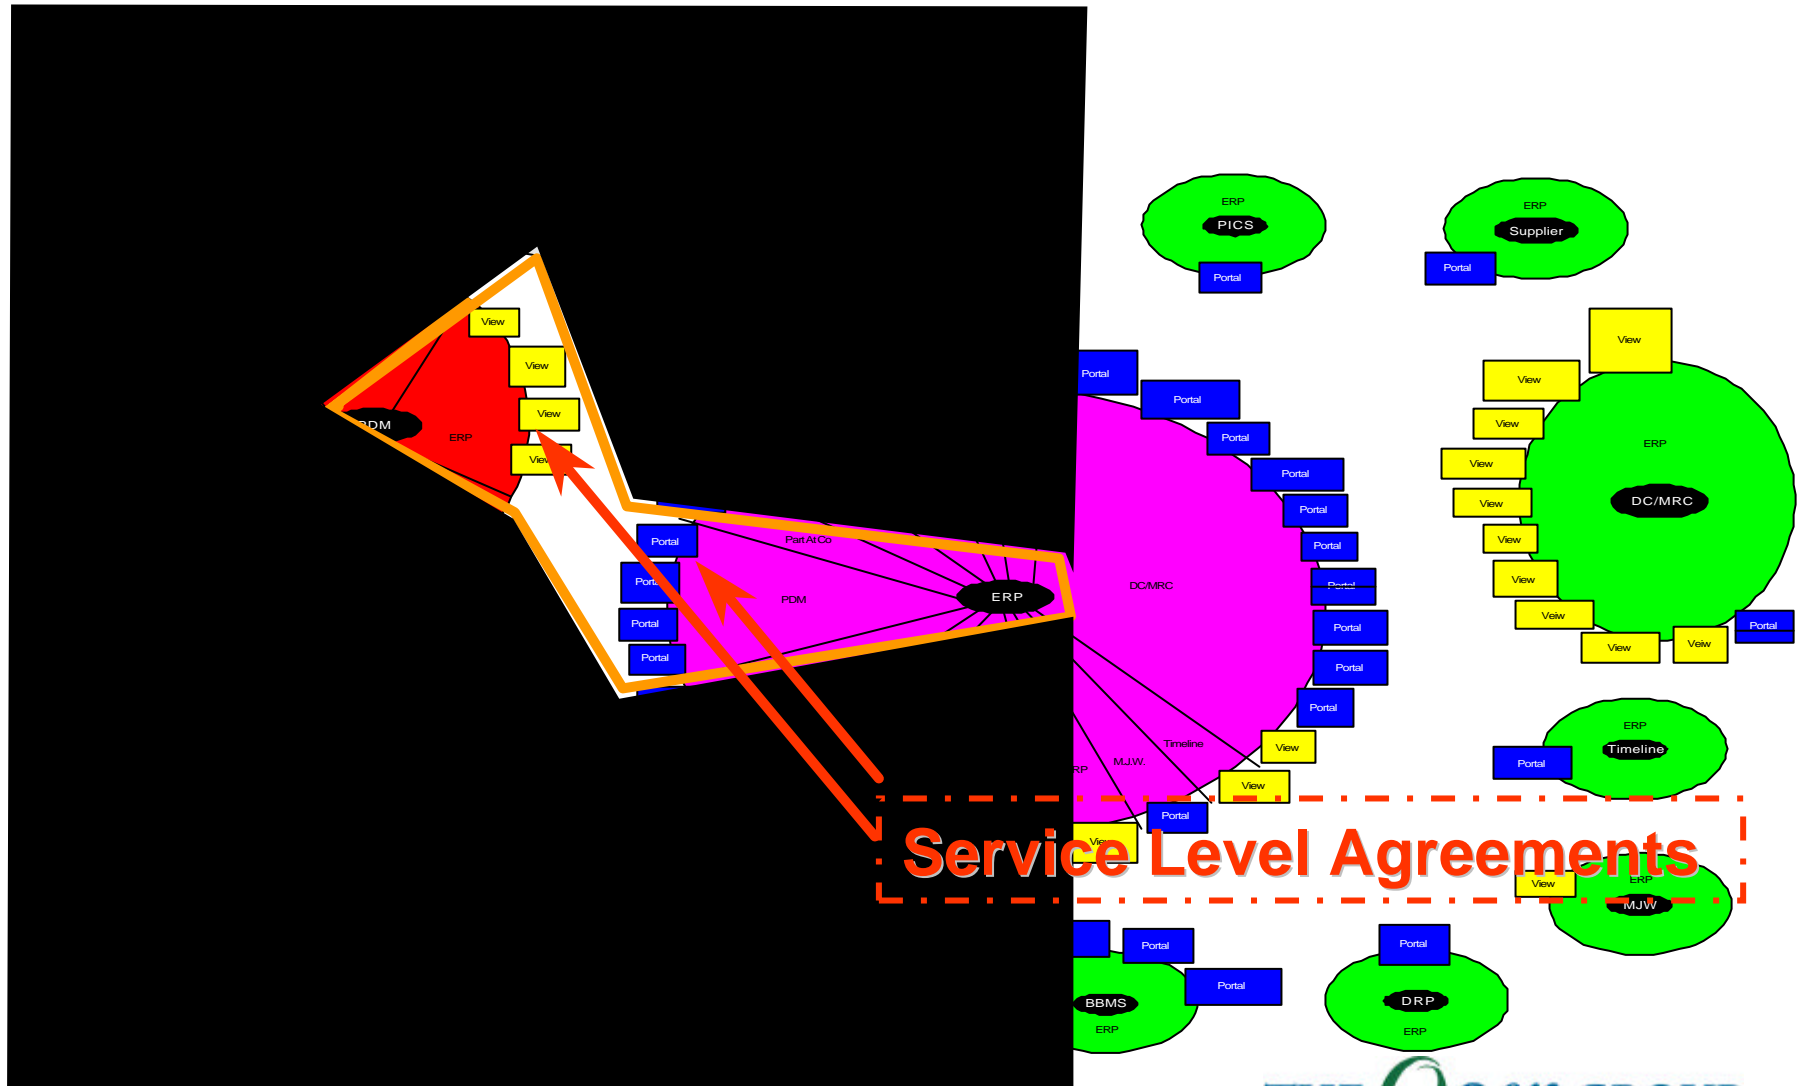

- ❑ DCAC/MRM system supports manufacturing operations at multiple sites
- ❑ Slow response impacts factory manpower and inventory
  - *“Thou shall not idle the factory floor!”*
- ❑ Overall customer satisfaction
  - Service is measurable and actionable
  - Support for IT spend decisions
- ❑ Mechanism to quantify IT priorities

# SLAs in DCAC/MRM

---

- ❑ SLAs represent agreement between manufacturing users and IT management on acceptable level of transaction response time
  - Enforcement based on percentage of transactions that exceed limit within a stated time period
  - Metrics agreed up front and shared with users
- ❑ Focused on top 20% of critical business transactions
  - This still results in 100+ SLAs

# SLAs and Transactions

# SLA Policy and Mechanism

---

- ❑ SLA represents performance policy on highest level of transaction
- ❑ Performance measurement occurs at component level
- ❑ Note components may participate in multiple SLAs
  - Maintaining sufficient context for analysis is significant issue
  - Results in manual process for SLA enforcement

# Instrumentation

---

- Extensive component instrumentation provides mechanism to observe SLA compliance
  - Application components instrumented using ARM to measure transaction start-stop times
  - Contextual data such as network and CPU use also collected
  - Data kept in repository for later analysis
- Commercial tools used for analysis and display
  - OpenView, Measureware

# SLAs in Operation

---

- ❑ Users and IT staff monitor compliance using agreed measures
- ❑ Users report service problems to IT Help Desk
  - Triage process to dispatch appropriate action
- ❑ If analysis shows SLA not being met for 90% of transactions over specified time period, analysis and repair initiated by IT
  - Repairs prioritized by business impact
- ❑ SLAs also monitored for 100% compliance
  - May indicate overprovisioning or permissive specification

# SLA Issues From Scenario

---

- ❑ While SLAs represent end-to-end path through multiple components, measurements done at component level
  - Limited contextual information, unnecessary differences in data reporting = slow/costly correlation of instrumentation data to reported failure
  - Pushes up cost of Mean Time To Repair
- ❑ Gratuitous complexity still a problem

# SLA Issues From Scenario

---

- ❑ Different SLAs have different criticality to manufacturing business, however metrics don't contain sufficient context tags to allow differentiation of transaction flow data
  - Must distinguish critical from non-critical traffic in service restoration
  - Prevents automated resource prioritization or service restoration for critical flows

# Areas for Standardization

<b>Technical Needs</b>	<b>Standardization Areas</b>
<b>SLA Specification</b>	<ul style="list-style-type: none"><li>• Language and tools for creating and interpreting SLAs</li></ul>
<b>Prioritization of resources</b>	<ul style="list-style-type: none"><li>• CPU resource monitoring and control</li><li>• Network traffic differentiation and prioritization</li><li>• Mechanisms to pass application prioritization and classification through OS and middleware layers</li></ul>

# Areas for Standardization (2)

<b><i>Technical Needs</i></b>	<b><i>Standardization Areas</i></b>
<b>Instrumentation and data collection</b>	<ul style="list-style-type: none"><li>• Consistent application performance instrumentation</li><li>• Metrics at and below middleware layer</li><li>• Mechanisms for collecting and labeling contextual/situational information for performance and failure data</li><li>• Mechanisms for tying gathered data to application transaction flow</li></ul>

# Areas for Standardization (3)

<b><i>Technical Needs</i></b>	<b><i>Standardization Areas</i></b>
<b>Identification of performance bottlenecks and failures</b>	<ul style="list-style-type: none"><li>• Tools for correlation of performance and diagnostic information across multiple platforms</li><li>• Tools which display end-to-end views of performance, rather than component-focused approach</li><li>• Cross-platform and cross-resource resource monitoring tools</li></ul>

# Areas for Standardization (4)

---

<b><i>Technical Needs</i></b>	<b><i>Standardization Areas</i></b>
<b>Automation</b>	<ul style="list-style-type: none"><li>• Automated collection and reduction of performance, failure and contextual data</li><li>• Automated mechanisms for prioritized resource reassignment for service restoration</li></ul>
