Identity Management Business Scenario extension

6 Feb 2003

THE *Open* GROUP

Extend IDM business scenario

- decomposing the wide range of different Identity Management related problems and issues into discrete parts

- focusing each part to be specific to end-users' business (functional) requirements that seem to need identity management capabilities

- embodying a mix of pure online identity management, physical identification, and hybrid identification to arrive at realistic requirements

THE *Open* GROUP

Approach

- not presuppose that "Identity Management" itself is a business requirement

- will describe business operations that end users (individual or corporate) need or wish to achieve and why

- from this develop a set of requirements scenarios, which will very probably include identity management capabilities

THE *Open* GROUP

Two specific areas of requirements

- ❑ the requirements of individuals who want to make available certain information about themselves, for use by other people

- ❑ the requirements of a resource owner/holder who wants to provide a service to applicants but wants to make business judgements on each applicant so as to decide whether they are appropriate clients to do business with.

Timescale

❑ The draft package will be developed in consultation with the relevant members of The Open Group, over a period of 4 months.
